## Module 3 - Intra-day and Balancing Markets

3.4 Balancing market operation and clearing

## Setting the scene

- From the (previously cleared) day-ahead market:
- Balance of generation and consumption at quantity: $P^{S}$
- Day ahead price: $\lambda^{S}$
- Generators' schedules: $\hat{y}_{j}^{G}, j=1, \ldots, N_{G}$
- Demands' schedules: $\hat{y}_{i}^{D}, i=1, \ldots, N_{D}$
- Then reaching the balancing market:
- Imbalance to be handled: $\Delta P$
- Assume $N_{B}$ balancing generators, able to move both up $(\uparrow)$ and down $(\downarrow) \ldots$
- Their offers:
- Upward regulation: $P_{j}^{\uparrow}$, at price $\lambda_{j}^{\uparrow}, j=1, \ldots, N_{B}$
- Downward regulation: $P_{j}^{\downarrow}$, at price $\lambda_{j}^{\downarrow}, j=1, \ldots, N_{B}$
- One necessarily has:
- $\lambda_{j}^{\uparrow}>\lambda^{s}, j=1, \ldots, N_{B}$
- $\lambda_{j}^{\downarrow}<\lambda^{s},, j=1, \ldots, N_{B}$

## Day-ahead market clearing results

- After market clearing (from Module 2), the supply and demand schedules are:

| Supply id. | Schedule (MWh) | Demand id. | Schedule (MWh) |
| :---: | :---: | :---: | :---: |
| $\mathrm{G}_{1}$ | 120 | $\mathrm{D}_{1}$ | 250 |
| $\mathrm{G}_{2}$ | 50 | $\mathrm{D}_{2}$ | 300 |
| $\mathrm{G}_{3}$ | 200 | $\mathrm{D}_{3}$ | 120 |
| $\mathrm{G}_{4}$ | 400 | $\mathrm{D}_{4}$ | 80 |
| $\mathrm{G}_{5}$ | 60 | $\mathrm{D}_{5}$ | 40 |
| $\mathrm{G}_{6}$ | 50 | $\mathrm{D}_{6}$ | 70 |
| $\mathrm{G}_{7}$ | 60 | $\mathrm{D}_{7}$ | 60 |
| $\mathrm{G}_{8}$ | 55 | $\mathrm{D}_{8}$ | 45 |
| $\mathrm{G}_{9}-\mathrm{G}_{15}$ | 0 | $\mathrm{D}_{9}$ | 30 |
|  |  | $D_{10}-\mathrm{D}_{12}$ | 0 |

- The system price is of $37.5 € / \mathrm{MWh}$, corresponding to the price offer of $G_{8}$

## Example list of balancing offers

- Deadline for offers: $30^{\text {th }}$ of January, 10:15 - Delivery period: $30^{\text {th }}$ of January, 11:00-12:00
- Balancing offers include:

| Company | id | $P_{j}^{\uparrow}(\mathrm{MWh})$ | $\lambda_{j}^{\uparrow}(€ / \mathrm{MWh})$ | $P_{j}^{\downarrow}(\mathrm{MWh})$ | $\lambda_{j}^{\downarrow}(€ / \mathrm{MWh})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| BlueHydro* | $\mathrm{B}_{1}\left(/ \mathrm{G}_{3}\right)$ | 30 | 40 | 20 | 35 |
| LastMinute | $\mathrm{B}_{2}$ | 40 | 45 | 30 | 25 |
| FlexiFast | $\mathrm{B}_{3}$ | 25 | 60 | 30 | 32 |
| DirtyPower* | $\mathrm{B}_{4}\left(/ \mathrm{G}_{8}\right)$ | 20 | 80 | 50 | 15 |

*already scheduled after day-ahead market clearing

- Here, only generators offer balancing - Demand could actually also contribute...

## Graphically as a supply curve...

- This is the same type of supply curves than for day-ahead auctions, except that:
- offers are for adjustment from the day-ahead quantity $P^{S}$ (both upward and downward)
- demand is here seen as inelastic (so, no demand curve - or seen as a vertical straight line)

Intuitively, two possible situations

$$
\Delta P>0
$$

(we need extra energy in the system)

$$
\Delta P<0
$$

(we have too much energy in the system)

## Writing the balancing auction as an LP

- Similarly to the day-market clearing, the auction can be solved through a Linear Program (LP):

$$
\begin{array}{ll}
\min _{\left\{y_{j}^{\uparrow}\right\},\left\{y_{j}^{\downarrow}\right\}} & \sum_{j} \lambda_{j}^{\uparrow} y_{j}^{\uparrow}-\lambda_{j}^{\downarrow} y_{j}^{\downarrow} \\
\text { subject to } & \sum_{j} y_{j}^{\uparrow}-y_{j}^{\downarrow}=\Delta P: \lambda^{B} \\
& 0 \leq y_{i}^{\uparrow} \leq P_{i}^{\uparrow}, j=1, \ldots, N_{B} \\
& 0 \leq y_{j}^{\downarrow} \leq P_{j}^{\downarrow}, j=1, \ldots, N_{B}
\end{array}
$$

- The balancing price $\lambda^{B}$ can then be obtained by solving the dual LP
- It corresponds to the lagrange multiplier for the updated balance equation
